IEEE ZAGAZIG Student Branch

IEEE COMPUTER SOCIETY ZAGAZIG STUDENT CHAPTER

@Backend:Phase1

Task 7

/Web-Basics

Greetings, I hope you are well and keeping safe. This is the final task of the 1st phase.

/Resources

$ Watch this playlist HTML-CSS Tutorial NetNinja to **the end.**

$ or watch this video HTML-Crash-Course to **the end, as we need only to learn HTML.**

$ other Arabic resources if you want:

> HTML-Abdelrahman-Gamal

> CSS-Abdelrahman-Gamal

/TODO

$ Part A: The "UniCore" Web Structure (HTML Only)

*You are building the **Frontend Skeleton** for the University System. Do **not** use CSS if you don't have time (it's a bonus if you do).*

Create a folder named UniCore_Pages and build these 4 files:

1. ***index.html* (The Landing Page)**
   - *A main heading (<h1>) welcoming users to UniCore.*
   - *A navigation bar (<nav>) with links to "Home", "About", and "Login".*
   - *A section describing the university using Paragraphs (<p>) and perhaps an Image (<img>) of a university (use a placeholder link or generate one with AI).*
   - *A footer (<footer>) with copyright info.*
2. ***register.html* (The Signup Form)**
   - *Create a Form (<form>) for new students.*
   - ***Required Fields:***
     - *Full Name (Text)*
     - *Email (Email type)*
     - *Password (Password type)*
     - *Date of Birth (Date type)*
     - *Department (Dropdown/Select menu with options like CS, IT, IS)*
     - *Gender (Radio buttons)*
   - ***Action:** A "Register" button.*
3. ***dashboard.html* (Student Dashboard)**
   - *Display the Student's Info using simple paragraphs.*

- **The Schedule:** Create a **Table** showing a weekly class schedule for the student.
  - Use `<thead>`, `<tbody>`, `<tr>`, `<th>`, and `<td>`.
- **Upcoming Exams:** A List of links to exam details.

4. **`contact.html` (Contact Admin)**
   - Use the `<address>` tag for the university location.
   - A link that opens the user's email client (`mailto:`) to send a message to the admin (let's make the admin email address `admin@unicore.fake`).
   - A text area (`<textarea>`) for feedback.

$ Part B: Research Questions

Answer the following questions in the file named **`research.md`**.

1. **GET vs POST:**
   - In the `<form>` tag, we have an attribute `method`. Explain the critical security and functional difference between `method="GET"` and `method="POST"`. Which one would you use for the `register.html` page and why?
2. **Semantic HTML:**
   - We could build the whole website using only `<div>` tags. Why is it "better" to use tags like `<header>`, `<main>`, `<section>`, and `<footer>`?
3. **The Request/Response Cycle:**
   - When you type `google.com` and hit Enter, briefly explain the steps your browser takes to fetch the page (Mention **DNS** and **IP**).

Note that you can use AI for searching and explaining all the things you don't understand, but make sure you understand everything after asking the AI and don't make the AI do the task for you.

/Submission Guidelines

> Inside your IEEE-ZSB-Backend-26 repository, create a new folder named HTML:

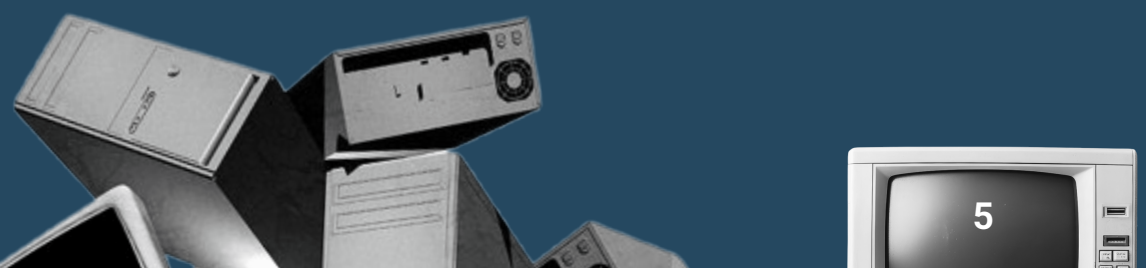
```
MySQL\
    Task_5\
        Task_5_Solutions.sql
        research.md
HTML\
    UniCore_Pages\ (Containing your 4 HTML files)
    research.md
```

/How-To-Submit

$ After you finish all of that, push your files to the repo as explained.

$ Submit the GitHub repository link on the task chat on **Discord.**

/Deadline

$ Tuesday, March 10 at **11:59 PM**


Wish you the best.❤️
